                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acide (NAs) comprising contacting a NA sample from a physiological acource, with a pool of 50 distinct gene specific primers under suitable conditions to enzymatically generate sub-population of NAs, where each gene specific primer has a sequence complementary to a distinct mRNA, and each labeled NA is generated using a single gene specific primer. The method is useful for producing a sub-population of labeled NAs which is useful for manlysing the differences in the RNA profiles between several different physiological sources, where the method comprises producing cubpopulation of labeled NAs for the different physiological sources, comprising the population, where the comparison is preferably differences in the population, where the comparison is preferably comprising the labeled NAs for each of the distinct physiological sources to a substrate to produce a hybridisation pattern for each of the sources, where corresponds and comparing the patterns for each of the sources, where conferences in the produce and normal tissue of the sources, where conferences in the produce and normal tissue e.g. neoplastic a normal expression analysis of diseased a normal tissue e.g. neoplastic a normal companies of the invention. The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
conn-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
connection of the genes is differentially expressed in peripheral
compared to PBMCs of normal humans. The method is useful for diagnosing
compared to PBMCs of normal humans. The method is useful for diagnosing
conn-blood disease such as solid tumor. The solid tumor is chosen from
continuous (RCC), prostate cancer and head/neck cancer. The
peripheral blood sample comprises enriched PBMCs. The peripheral blood
cample is a whole blood sample (claimed). (M1) is useful for identifying
content that are differentially expressed in peripheral blood sample
isolated at differentially expressed in development or treatment of
content a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer;
peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (Claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene, that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
cc non-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
cgenes, where each of the genes is differentially expressed in peripheral
cc blood monnolear cells (PBMCs) of patients having the disease as
compared to PBMCs of normal humans. The solid tumor is chosen from
compared to PBMCs of normal humans. The solid tumor is chosen from
compared to ample comprises enriched PBMCs. The peripheral blood
sample is a whole blood sample (claimed). (M1) is useful for identifying
genes that are differentially expressed in peripheral blood sample
cs isolated at different stages of progression, development or treatment of
cRC and/or other solid tumors. This sequence corresponds to a probe to
detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss, diagnosis, non-blood disease, solid tumor, gene expression, peripheral blood mononuclear cell, renal cell carcinoma, prostate cancer, head/neck cancer, differential expression, probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Renal cell carcinoma differentially expressed gene probe #995.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 25; DB 1; Length 25; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   22225222222
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of human having in the peripheral blood sample to reference expression profile of the genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (Claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples of progression, development or treatment of solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relate to a method of diagnosing (MI) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral constant of the genes is differentially expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (Claimed). (MI) is useful for identifying sense that are differentially expressed in peripheral blood samples is isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                      Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                             Stover JA;

The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
non-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
genes, where each of the genes is differentially expressed in peripheral
blood mononclear cells (PBMCs) of patients having the disease as
compared to PBMCs of normal humans. The method is useful for diagnosing
non-blood disease such as solid tumor. The solid tumor is chosen from
renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
peripheral blood sample comprises enriched PBMCs. The peripheral blood
sample is a whole blood sample (claimed). (M1) is useful for identifying
genes that are differentially expressed in peripheral blood samples
isolated at different stages of progression, development or treatment of
RCC and/or other solid tumors. This sequence corresponds to a probe to
detect a gene that is differentially expressed and detected by the method
of the invention.

such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes is differentially expressed in peripheral blood sample to reference expression profile of the genes is differentially expressed in peripheral blood monounclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosting non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples isolated at different stages of progression, development or treatment of RC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relate to a method of diagnosing (M1) non-blood disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Renal cell carcinoma differentially expressed gene probe #989.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1.5%; Score 25; DB 1; Length 25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes in the peripheral blood sample to reference expressed in peripheral cance monounclear cells (PBMCs) of patients having the disease as blood monounclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample is a whole blood sample (Calaimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples (Cand/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                se; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ద
                                                                                                                                                                                                                                                                                                                         The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
non-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
genes, where each of the genes is differentially expressed in peripheral
blood mononuclear cells (PBMCs) of patients having the disease as
compared to PBMCs of normal humans. The method is useful for diagnosing
non-blood disease such as solid tumor. The solid tumor is chosen from
non-blood disease such as solid tumor. The solid tumor is chosen from
con-blood disease such as solid tumor. The solid tumor is chosen from
peripheral blood sample comprises enriched PBMCs. The peripheral blood
sample is a whole blood sample (claimed). (M1) is useful for identifying
genes that are differentially expressed in peripheral blood samples
closlated at different stadges of progression, development or treatment of
RCC and/or other solid tumors. This sequence corresponds to a probe to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having con-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the compared of the genes is differentially expressed in peripheral compared of the genes is differentially expressed in peripheral compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from con-blood disease such as solid tumor. The solid tumor is chosen from con-blood sample comprises enriched PBMCs. The peripheral blood sample (Calined). (M1) is useful for identifying sample is a whole blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples compared at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.

The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
non-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
genes, where each of the genes is differentially expressed in peripheral
blood mononuclear cells (PBMCs) of patients having the disease as
blood mononuclear cells (PBMCs) of patients having the disease as
compared to PBMCs of normal humans. The method is useful for diagnosing
non-blood disease such as solid tumor. The solid tumor is chosen from
renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
peripheral blood sample comprises enriched PBMCs. The peripheral blood
sample is a whole blood sample (claimed). (M1) is useful for identifying
genes that are differentially expressed in peripheral blood samples
isolated at different stages of progression, development or treatment of
RCC and/or other solid tumors. This sequence corresponds to a probe to
detect a gene, that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; diagnosis; non-blood disease; solid tumor; gene expression;
peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer;
head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                   Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Renal cell carcinoma differentially expressed gene probe #984.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relate to a method of diagnosing (M1) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes, where each of the genes is differentially expressed in peripheral blood monounclear cells (PBMCs) of patients having the disease as compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed). (M1) is useful for identifying genes that are differentially expressed in peripheral blood samples is a whole blood sample (claimed). (M1) is useful for identifying genes that are different stages of progression, development or treatment of
                                                                                                                                                                                                                                                                                                                  Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                Stover JA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relate to a method of diagnosing (M1) non-blood disease
such as solid tumor by providing peripheral blood sample of human having
non-blood disease, and comparing an expression profile of specific genes
in the peripheral blood sample to reference expression profile of the
genes, where each of the genes is differentially expressed in peripheral
blood monounclear cells (PBMCs) of patients having the disease as
compared to PBMCs of normal humans. The method is useful for diagnosing
non-blood disease such as solid tumor. The solid tumor is chosen from
renal cell carcinoma (RCC), prostate cancer and head/neck cancer. The
peripheral blood sample comprises enriched PBMCs. The peripheral blood
sample is a whole blood sample (claimed). (M1) is useful for identifying
genes that are differentially expressed in peripheral blood samples
isolated at different stages of progression, development or treatment of
RCC and/or other solid tumors. This sequence corresponds to a probe to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

The invention relate to a method of diagnosing (M1) non-blood disease

such as solid tumor by providing peripheral blood sample of human having

con-blood disease, and comparing an expression profile of specific genes

in the peripheral blood sample to reference expression profile of the

genes, where each of the genes is differentially expressed in peripheral

blood monnoulear cells (PBMCs) of patients having the disease as

compared to PBMCs of normal humans. The method is useful for diagnosing

non-blood disease such as solid tumor. The solid tumor is chosen from

compared to PBMCs of normal humans. The solid tumor is chosen from

compared to PBMCs of normal humans (RCC), prostate cancer and head/neck cancer. The

peripheral blood sample comprises enriched PBMCs. The peripheral blood

sample is a whole blood sample (claimed). (M1) is useful for identifying

genes that are differentially expressed in peripheral blood samples

contacted at different stages of progression, development or treatment of

RCC and/or other solid tumors. This sequence corresponds to a probe to

detect a gene that is differentially expressed and detected by the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ss; diagnosis; non-blood disease; solid tumor; gene expression; peripheral blood mononuclear cell; renal cell carcinoma; prostate cancer; head/neck cancer; differential expression; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes

The invention comprises antisense oligonucleotides that are capable of inhibiting expression of the human clusterin gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of clusterin in cells. The antisense oligonucleotides are also useful for treating an animal with a disease or condition associated with hyperpoliferative disorders, and hyperplaining in an animal with a disease or condition associated with hyperpoliferative disorders, and hyperplaining and physical and physical disorders. The present DNA sequence represents a PCR primer used to amplify the human clusterin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              a phosphorothioate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence ACF36398 (I) is used: (a) to delay progression of androgen-senaitive prostatic cancer cells to the androgen-independent state, in vivo or in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TRPM-2; testosterone-repressed prostate message-2; cytostatic; RT-PCR; androgen; prostate cancer; anti-apoptotic protein; antisense; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relate to a method of diagnosing (MI) non-blood disease such as solid tumor by providing peripheral blood sample of human having non-blood disease, and comparing an expression profile of specific genes in the peripheral blood sample to reference expression profile of the genes is differentially expressed in peripheral blood annohuclear cells (PBMCs) of patients having the disease as the compared to PBMCs of normal humans. The method is useful for diagnosing non-blood disease such as solid tumor. The solid tumor is chosen from compared to PBMCs, prostate cancer and head/neck cancer. The peripheral blood sample comprises enriched PBMCs. The peripheral blood sample (claimed). (MI) is useful for identifying genes that are differentially expressed in peripheral blood samples? isolated at different stages of progression, development or treatment of RCC and/or other solid tumors. This sequence corresponds to a probe to detect a gene that is differentially expressed and detected by the method contract of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                  Diagnosing non-blood disease such as solid tumor, involves comparing differential expression profile of specific genes in peripheral blood sample of subject with reference expression profile of specific genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

PCR primer for amplifying the anti-apoptotic protein TRPM-2 (testosterone

```
The invention relates to a compound consisting of an oligonucleotide with a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-0-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy, and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence ACR5638 (I) is used: (a) to delay progression of androgen-sensitive prostatic cancer cells to the androgen-independent state, in vivo or in viro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, calls (prostatic, renal, non-small cell) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and increase stability in vivo and activity (both in vivo or in vitro) and chemotherapeutic agents or other antisense oligonucleotides directed against other antiapoptotic genes. The present sequence represents a RT-
                                                                                                                                                                                                                                                                                                                                                   ö
vitro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, ovarian and some breat cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and result in a synergistic increase in effect when (I) is used with chemotherapeutic agents or other antisense oligonucleotides directed against other antiapopotic genes. The present sequence represents a RT-PCR primer for amplifying the anti-apoptotic protein TRPM-2 (testosterone-repressed prostate message-2) cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TRPM-2; testosterone-repressed prostate message-2; cytostatic; RT-PCR; androgen; prostate cancer; anti-apoptotic protein; antisense; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or addationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM -2) amplifying RT-PCR primer. The primer is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                                                                                                                                                                           Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity, radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human; reverse transcription; RT-PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM amplifying RT-PCR primer. The primer is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                               Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity; raddation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human; reverse transcription; RT-PCR; primer; ss.

The present sequence is a human clusterin cDNA target for a double-stranded short interfering RNA (siRNA) of the invention ADL/0522-ADL/0523. It was used in an example from the invention to demonstrate clusterin gene silencing in PC-3 prostate cancer cells. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplactic large cell lymphoma and melanoma, and also for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a human clusterin cDNA target for a double-stranded short interfering RNA (siRNA) of the invention ADL70513-DL70513-L twas used in an example from the invention to demonstrate clusterin gene silencing in PC-3 prostate cancer cells. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, an amplastic large cell lymphoma and melanoma, and also for the treatment
                                                                                                                                                                                                                                                                                                    New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

The present sequence is a human clusterin cDNA target for a double-stranded short interfering RNA (siRNA) of the invention ADL70316-ADL70317. It was used in an example from the invention to demonstrate clusterin gene silenchig in PC-3 prostate cancer cells. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SirNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RNA interference, RNAi, short interfering RNA; siRNA; human, clusterin, cytostatic, neuroprotective, nootropic, gene silencing; DNA-RNA hybrid;

The present sequence is a PCR primer for the porcine clusterin gene. Clusterin (also known as complement cytolysis inhibitor, sulfated glycoprotein-2, testosterone repressed prostate message-2, SP-40, 40 and ApoJ) is essential for the migration of vascular smooth muscle cells (VSMC). The gene and protein can, therefore, be used to promote wound healing, angiogenesis and vasculogenesis, in the treatment of stenosis following vascular trauma or disease and to treat atherosclerosis, and antisense sequences can be used to treat cancer, as angiogenesis is vital for tumour survival
                                                                                                                                                                                  The present sequence is a human chromosome 8p clustrin gene (CL1) specific PCR primer, which was used in the confirmation of the regional mapping of the human steroidogenesis acute regulatory protein (hStAR)
                                                          Isolated human steroidogenesis acute regulatory protein gene - used for detection of mutation(s) of this gene that cause congenital lipoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Clusterin and gp38K-related peptide capable of altering cell migration useful for treating atherosclerosis, cancer and stenosis following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pig, clusterin, cell migration, wound healing; angiogenesis; cancer; vascular trauma; vascular disease; atheroscilerosis; restenosis; complement cytolysis inhibitor; SP-40; 40; apoJ; testosterone repressed prostate message-2; sulfated glycoprotein-2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ઠે
                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a human clusterin cDNA target for a double-stranded short interfering RNA (siRNA) of the invention ADL70519-ADL70520. It was used in an example from the invention to demonstrate clusterin gene silencing in PC-3 prostate cancer cells. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, anaplastic large call lymphoma and melanoma, and also for the treatment

The present sequence is an antisense oligonucleotide directed at the human testosterone-repressed prostate message-2 (TRPM-2, also known as olusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemosensitivity of the cells, meaning that conventional chemotherapy is
                                                                                                                                                                                                                                                                                                                                              Treating prostatic tumors and renal cancers by antisense inhibition of the testosterone-repressed prostate messenger-2 gene.

The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemotherapy is

                                                                                                                                                   human testosterone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligomucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal call cancer and some breast cancer cells. In addition to this, they also increase the chemosensitivity of the cells, meaning that conventional chemotherapy is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 human testosterone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumnours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumnour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast chancer cells. In addition to this, they also increase the chance the chance effective meaning that conventional chemotherapy is
                                               Treating prostatic tumors and renal cancers by antisense inhibition of the testosterone-repressed prostate messenger-2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating prostatic tumors and renal cancers by antisense inhibition of the testosterone-repressed prostate messenger-2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, testosterone-repressed prostate message-2; TRPM-2; clusterin; sulfated glycoprotein-2; SGP-2; cancer; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is an antisense oligonucleotide directed at the human testosterone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemotherapy is

The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemosensitivity of the cells, meaning that conventional chemotherapy is
                                                                                                                                                                                                                                                                                                                            Treating prostatic tumors and renal cancers by antisense inhibition of the testosterone-repressed prostate messenger-2 gene.

The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemotherapy is
                                                                                                                                                    human testosterone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemospenitivity of the cells, meaning that conventional chemotherapy is

The present sequence is an antisense oligonucleotide directed at the human testostezone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemotherapy is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-2 gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemotherapy is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, etroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; variant thrombospondin 1; variant thrombospondin 4; SNP;

                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The persent sequence is an aphenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the disgnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides a method of diagnosing a vascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mccarthy JJ;

                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                           The invention comprises antisense oligonucleotides that are capable of inhibiting expression of the human clusterin gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of clusterin in cells. The antisense oligonucleotides are also useful for treating an animal with a disease or condition associated with hyperproliferative disorders, and hyperlipidemic disorders). The present bNA sequence represents a PCR probe specific for the human clusterin gene. NOTE: The present sequence is labelled with a fluorescent reporter

a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the cremaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence ACP36398 (I) is used: (a) to delay progression of androgen-sensitive control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a compound consisting of an oligonucleotide with a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-decepty and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence Aprostatic nucleotides and 19 are 5-methylated. Oligonucleotide shown in sequence prostatic cancer cells to the androgen-sensitive prostatic cancer cells to the androgen-independent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TRPM-2; testosterone-repressed prostate message-2; cytostatic; androgen; prostate cancer; anti-apoptotic protein; antisense; ss.

The invention relates to a compound consisting of an oligonucleotide with a phosphorothioate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-0-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence ACR5638 (I) is used: (a) to delay progression of androgen-sensitive prostatic cancer cells to the androgen-independent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell) lung, urothalial transitional, ovarian and some breast cancer calls) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and crease tability in vivo and activity (both in vivo or in vitro) and chemotherapeutic agents or other antisense oligonucleotides directed against other antiapoptotic genes. Sequences ACR36399-406 represent
                                                                                                                                                                                                                                                                                                                     ö
androgens to induce apoptosis); and (c) to increase sensitivity of cancer
                 cells (prostatic, renal, non-small cell lung, urothelial transitional, ovarian and some breast cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and result in a synergistic increase in effect when (I) is used with chemotherapoutic agents or other antisense oligonucleotides directed against other antiapoptotic genes. Sequences ACF36199-406 represent antisense oligonucleotides targeted against human anti-apoptotic protein TRPM-2 (testosterone-repressed prostate message-2) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TRPM-2; testosterone-repressed prostate message-2; cytostatic; androgen; prostate cancer; anti-apoptotic protein; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-O-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines and the positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence prostatic cancer cells to the androgen-independent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancercells (prostatic cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) increase stability in vivo and activity (both in vivo or in vitro) and result in a synergistic increase in effect when (I) is used with chemotherapeutic agents or other antisense oligonucleotides directed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a compound consisting of an oligonucleotide with
antisense oligonucleotides targeted against human anti-apoptotic protein TRPM-2 (testosterone-repressed prostate message-2) gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      TRPM-2; testosterone-repressed prostate message-2; cytostatic; androgen;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          against other antiapoptotic genes. Sequences ACF36399-406 represent antisense oligonucleotides targeted against human anti-apoptotic protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to a compound consisting of an oligonuclectide with a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-0-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence created and repeated on the conference of the conference of the androgen-sindependent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing cancer calls (prostatic renal, non-small cell lung, urothelial transitional, cells (prostatic, renal, non-small cell lung, urothelial transitional, covarian and some breast cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (1) increase stability in vivo and activity (both in vivo or in vitro) and cresult in a synergistic increase in effect when (1) is used with chemotherapeutic agents or other antisense oligonucleotides targeted against thuman anti-apoptotic protein and property or median antisense oligonucleotides targeted against thuman anti-apoptotic protein and property or mediants and activity (both in vivo and present antisense oligonucleotides targeted against thuman anti-apoptotic protein and property or mediants and process and process of the protein and process and

```
The invention relates to a compound consisting of an oligonucleotide with a phosphorothicate backbone throughout, in which: (a) sugars on nucleotide residues 1-4 and 18-21 are 2'-0-methoxyethyl modified, and the nucleotide residues 1-4 and 18-21 are 2'-deoxy; and (b) the cytosines at positions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence of ACF36398 (I) is used: (a) to delay progression of androgen-sensitive correct cancer cells to the androgen-independent state, in vivo or in vitro; (b) to treat prostatic cancer (after initially withdrawing androgens to induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, ovarian and some breast cancer calls) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (I) in crease stability in vivo and activity (both in vivo or in vitro) and result in a synergistic increase in effect when (I) is used with chemotherapeutic agents or other antisense oligonucleotides directed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New modified antisense oligonucleotide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                     against other antiapoptotic genes. Sequences AČF36399-406 represent antisense oligonucleotides targeted against human anti-apoptotic protein
                                                                New modified antisense oligonuclectide, useful particularly for treating prostatic cancer, inhibits the testosterone-repressed prostate message-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TRPM-2; testosterone-repressed prostate message-2; cytostatic; androgen;

The invention relates to a compound consisting of an oligonucleotide with a phosphorothicate backbone throughout, in which: (a) sugars on nucleotides seldues 1-4 and 18-21 are 2'-0-methoxyethyl modified, and the remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at remaining nucleotides 5-17 are 2'-deoxy; and (b) the cytosines at posttions 1, 4 and 19 are 5-methylated. Oligonucleotide shown in sequence constraints and 19 are 5-methylated. Oligonucleotide shown in sequence constraints and 19 are 5-methylated. Oligonucleotide shown in sequence confortable (b) to treat prostatic cancer (after initially withdrawing control induce apoptosis); and (c) to increase sensitivity of cancer cells (prostatic, renal, non-small cell lung, urothelial transitional, covarian and some breast cancer cells) that express abnormal levels of TRPM-2 to chemotherapy or radiation. The modifications present in (1) increase stability in vivo and activity (both in vivo or in vitro) and created against the asynergistic increase in effect when (1) is used with conforted against other antiapoptotic genes. Sequences ACF36399-406 represent antisense oligonucleotides targeted against them anti-apoptotic protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel methods of screening to identify epigenetically silenced genes. Specifically, it refers to the detection of epigenetically silenced tumour suppressor genes in cancer cells, which are transcriptionally inactive due to aberrant methylation at normally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying at least one epigenetically silenced gene associated with cancer useful for treating cancer comprises contacting an array of genome with nucleic acid molecule that reactivates expression of epigenetically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human; primer; RT-PCR; PCR; ss; epigenetically silenced gene; tumour suppressor; cancer; proliferative disorder; head and neck cancer; oesophageal squamous cell carcinoma; BSCC; gene therapy; methyltransferase inhibitor; 5Aza-dC; histone deacetylase inhibitor.

predisposition to, or exhibiting, unregulated growth. Accordingly, objigonation to, or exhibiting, unregulated growth. Accordingly, objigonationtectides of the genes identified herein are useful for detecting coscophageal squamous cell carcinoma (ESCC) or neck squamous cell carcinoma. Furthermore, treatment can occur via gene therapy, using a histonic deacetylase inhibitor to restore expression of at least one methylation silenced gene in cancer cells. This oligonucleotide sequence is an RT-PCR primer used to amplify those genes that were up-regulated as a result of treatment with a demethylation agent i.e epigenetically

cc markers for immortalised and transformed cells and hence can be used to diagnose various proliferative disorders, particularly oseophageal cancer and head and neck cancer. The present invention describes a genomic and head and neck cancer. The present invention describes a genomic correning method to identify silenced genes in a cell suspected of a predisposition to, or exhibiting, unregulated growth. Accordingly, colloponucleotides of the genes identified herein are useful for detecting coepophageal squamous cell carcinoma (ESCC) or neck squamous cell carcinoma. Furthermore, treatment can occur via gene therapy, using a demethylation agent such a methyltransferase inhibitor (5Aza-dC) or a histone deacerylase inhibitor to restore expression of at least one methylation silenced gene in cancer cells. This oligonucleotide sequence is an RT-PCR primer used to amplify those genes that were up-regulated as a result of treatment with a demethylation agent i.e epigenetically silenced genes of the invention.

This invention relates to novel methods of screening to identify epigenetically silenced genes. Specifically, it refers to the detection of epigenetically silenced tumour suppressor genes in cancer cells, which are transcriptionally inactive due to aberrant methylation at normally unmethylated CpG islands. Accordingly, these genes provide diagnostic markers for immortalised and transformed cells and hence can be used to diagnose various proliferative disorders, particularly oesophageal cancer and head and neck cancer. The present invention describes a genomic

Identifying at least one epigenetically silenced gene associated with cancer useful for treating cancer comprises contacting an array of genome with nucleic acid molecule that reactivates expression of epigenetically

Example 1; SEQ ID NO 28; 97pp; English.

silenced gene.

The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiation-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                                                                                                                                                   Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity, radiation-sensitivity, prostate cancer, bladder cancer, ovarian cancer, lung cancer, renal cell carcinoma; RCC; antisense gene therapy; human;

bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM -2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The

                                                                  ሯ
                                                                             ö
present sequence is human testosterone-repressed prostate message-2 (TRPM -2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (FCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM-2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                                                                                    Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity; radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human;

The invention is useful for enhancing the chemo-sensitivity or cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM 2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity; radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human;

The present invention provides a method for treating cancer in which cancer calls express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or tradiation-sensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM-2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                               Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity, radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-resed prostate message-2 (TRPM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                                                                 Testosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity; radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human;

                                 The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM -2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.
                                                                                                                                                                                                          Teatosterone-repressed prostate message-2; TRPM-2; chemo-sensitivity; radiation-sensitivity; prostate cancer; bladder cancer; ovarian cancer; lung cancer; renal cell carcinoma; RCC; antisense gene therapy; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1.3%; Score 21; DB 1; Length 21;

                                                         The present invention provides a method for treating cancer in which cancer calls express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or tradiation-sensitivity of cancer calls for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM -2) antisense oligodeoxyribonucleotide (ODN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The present sequence is the sense strand of a short interfering RNA (siRNA) targeted to nucleotides 487-505 of human clusterin cDNA. The antisense strand is also provided ADL70457. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, breast cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a method for treating cancer in which cancer cells express testosterone-repressed prostate message-2 (TRPM-2). The invention is useful for enhancing the chemo-sensitivity or radiationsensitivity of cancer cells for treating cancer such as prostate cancer, bladder cancer, ovarian cancer, lung cancer and renal cell carcinoma (RCC). The invention is also useful in antisense gene therapy. The present sequence is human testosterone-repressed prostate message-2 (TRPM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enhancing the chemo-sensitivity or radiation-sensitivity of cancer cells that expresses testosterone-repressed prostate message-2 (TRPM-2) comprises administering a composition that inhibits expression of TRPM-2.

The present sequence is the sense strand of a short interfering RNA (siRNA) targeted to nucleotides 1620-1638 of human clusterin cDNA. The antisense strand is also provided ADL'0461. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prosette message-2 (TRRM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in moune andels of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment

The present sequence is the sense strand of a short interfering RNA (sirNA) targeted to a specific portion ADL70512 of human clusterin cDNA. The antisense strand is also provided ADL70512 of human clusterin cDNA. The antisense strand is also provided ADL70512 of human clusterin cDNA. Interfere with the expression of clusterin. Clusterin, also known as createstcone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate clumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. Sinnas of the invention can be used alone or in combination with other critical for apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, broast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease. In an example from the invention, the present sixNA was used to examine the effects of clusterin gene silencing in PC-3 prostate cancer cells. A reduction in clusterin transcript was observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the sense strand of a short interfering RNA antisense strand is also provided ADL70459. The siRNA can be used to antisense strand is also provided ADL70459. The siRNA can be used to therefore with the expression of Clusterin. Clusterin, also known as testosterone-repressed prostete message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounte by prostate cult following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's disease or cancer.
                                                                RNA interference; RNAi; short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective; nootropic; gene silencing; DNA-RNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present sequence is the antisense strand of a short interfering RNA (siRNA) targeted to a specific portion ADL70518 of human clusterin CDNA. CT the sense strand is also provided ADL70519. The siRNA can be used to The sense strand is also provided ADL70519. The siRNA can be used to the strand strand is also provided ADL70519. The siRNA can be used to the strand as a customers of the siRNA as a sexpressed in increased amounts by prostate (siRNAs of the invention can be used alone or in combination with other constants of the invention can be used alone or in combination with other constants are appressed in the strand call carcinoma, constant cancer, bladder cancer, lung cancer, colon cancer, our applestic large cell lymphoma and melanoma, and also for the treatment of breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, canaplastic large cell lymphoma and melanoma, and also for the treatment of breast cancer, sised sease. In an example from the invention, the present of Alzheimer's disease. In an example from the invention, the present sirand was used to examine the effects of clusterin gene silencing in PC-3 prostate cancer cells. A reduction in clusterin transcript was observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's disease or cancer.
                                                                           RNA interference; RNAi; short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective; nootropic; gene silencing; DNA-RNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The present sequence is the antisense strand of a short interfering RNA feargated to nuclectides 1620-1638 of human clusterin CDNA. The sense strand is also provided ADL70460. The SIRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be sirNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, anaplastic large cell lymphoma and melanoma, and also for the treatment of anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

                RESULT 76
                               ADL7051
                                                        The present sequence is the antisense strand of a short interfering RNA (siRNA) targeted to a specific portion ADL70515 of human clusterin cDNA. The sense strand is also provided ADL70516. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. siRNAs of the invention can be used alone or in combination with other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease. In an example from the invention, the present siRNA was used to examine the effects of clusterin gene silencing in PC-3
                                                                                                                       RNA interference; RNAi; short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective; nootropic; gene silencing; DNA-RNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   prostate cancer cells. A reduction in clusterin transcript was observed

The present sequence is the sense strand of a short interfering RNA (siRNA) targeted to a specific portion ADL70515 of human clusterin cDNA. The antisense strand is also provided ADL70517. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate currour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other critical for neuritic toxicity in mouse models for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal call carcinoma, breast cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large call lymphoma and melanoma, and also for the treatment of Alzheimer's disease. In an example from the invention, the present sIRNA was used to examine the effects of clusterin gene silencing in PC-3 prostate cancer cells. A reduction in clusterin transcript was observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

RNAi for human clusterin.

```
The present sequence is the antsense strand of a short interfering RNA sense strand is also provided ADL70456. The siRNA can be used to interfere with the expression of clusterin, also known as glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other chemocherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, anaplastic large cell lymphoma and melanoma, and also for the treatment of anaplastic large cell lymphoma and melanoma, and also for the treatment cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's
                                                                                                                                                                                                                  RNA interference, RNAi, short interfering RNA; siRNA; human; clusterin; cytostatic; neuroprotective, nootropic; gene silencing; DNA-RNA hybrid;

```
New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the antisense strand of a short interfering RNA (siRNA) targeted to nucleotides 1105-1123 of human clusterin cDNA. The sense strand is also provided ADJ70458. The siRNA can be used to interfere with the expression of clusterin. Clusterin, also known as testosterone-repressed prostate message-2 (TRPM-2) or sulfated glycoprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SiRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of prostate cancer, sarcomas such as osteosarcoma, renal cell carcinoma, breast cancer, bander cancer, lung cancer, colon cancer, ovarian cancer, of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 21 BP; 4 A; 2 C; 9 G; 2 T; 4 U; 0 Other;

```
The present sequence is the antisense strand of a short interfering RNA (siRNA) targeted to a specific portion ADL/0512 of human clusterin cDNA. The seases strand is also provided ADL/0513. The siRNA can be used to interfere with the expression of clusterin. Also known as testosterone-repressed proctate message-2 (TRPM-2) or sulfated GJV cprotein-2 (SGP-2), is expressed in increased amounts by prostate tumour cells following androgen withdrawal, and has also been shown to be critical for neuritic toxicity in mouse models of Alzheimer's disease. SIRNAs of the invention can be used alone or in combination with other chemotherapy or apoptosis inducing treatments for the treatment of brostate cancer, bladder cancer, lung cancer, colon cancer, ovarian cancer, brader cancer, lung cancer, colon cancer, ovarian cancer, anaplastic large cell lymphoma and melanoma, and also for the treatment of anaplastic large cell lymphoma and melanoma, and also for the treatment of Alzheimer's disease. In an example from the invention, the present siRNA was used to examine the effects of clusterin gene silencing in PC-3 prostate cancer cells. A reduction in clusterin transcript was observed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New RNA molecule less than 49 bases and having a sequence effective to mediate degradation or block translation of mRNA that is the transcriptional product of a target gene, useful for treating Alzheimer's

```
The present sequence is that of an antisense oligonucleotide targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421.

The antisense oligonucleotides are complementary to a region of the clusterin mRNA spanning either translation initiation site or the termination site. They may be modified to increase stability in vivo, e.g. they may be employed as phosphorothicate derivatives and may have 2.

C. (2-methoxyethyl) modifications in the 5' and 3' 'wings', A method for regulating expression of bol-xi in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin administering an agent effective amount of clusterin of clusterin is reduced. Such regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bol-xi is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL7041 or short interfering RNA (siRNA) ADL7042-ADL7045 targeted to clusterin. The siRNAs molecules direct cleavage of clusterin mRNA. A method for regulating expression of bcl.xi in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl.xi is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl.xi is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of clusterin in the melanoma cells.

The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADD/0403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonocleotide ADD/0404-ADD/04021 or short interfering RNA (siRNA) ADD/0422-ADD/0435 targeted to clusterin. The siRNAs molecules direct cleavage of clusterin mRNA. A method for regulating expression of bol-xL in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bol-xL is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bol-xL is known to act as an inhibitor
comprises administering to the reduce the effective amount of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is that of an antisense oligonucleotide targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL704021 or short interfering RNA (sirMA) ADL70422-ADL70445 targeted to clusterin. The antisense oligonucleotides are complementary to a region of the clusterin mRNA spanning either the translation initiation site or the termination site. They may be modified to increase stability in vivo, e.g. they may be employed as phosphorothioate derivatives and may have 2' o'(2-methoxyethy!) modifications in the 5' and 3' wings'. A method for regulating expression of bcl-tx in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl-xL is down-

The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin.
regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl-xL is known to act as an inhibitor of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the

The antisense oligonucleotides are complementary to a region of the clusterin mRNA spanning either the translation initiation site or the termination site. They may be modified to increase stability in vivo, e.g. they may be employed as phosphorothioate derivatives and may have 2'-0-(2-methoxyethyl) modifications in the 5' and 3' wings'. A method for regulating expression of bcl-xL in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl-xL is downregulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl-xL is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of clusterin in the melanoma cells.

                     human clusterin ADL70403. The invention relates to the treatment of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering NNA (sirNA) ADL70422-ADL70445 targeted to clusterin. The antisense oligonucleotides are complementary to a region of the clusterin mRNA apanning either the translation initiation site or the termination site. They may be employed as phosphorothicate derivatives and may have 2' o' (2-methoxyethyl) modifications in the 5' and 3' wings'. A method for regularing expression of bol-xi, in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin administering an effective to modulate the amount of clusterin regulated when the effective amount of clusterin expression in clusterin-expressing cells, expression of bol-xi is downregulated when the effective amount of clusterin is reduced. Such inhibition is significant because bol-xi is known to act as an inhibitor
The present sequence is that of an antisense oligonucleotide targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of

The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL70445 targeted to clusterin. The siRNAB molecules direct cleavage of clusterin mRNA. A method for regulating expression of bol-xL in a subject or cell into comparises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bol-xL is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bol-xL is known to act as an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating melanoma in a mammalian subject comprises administering to the

                                                                                                                                                                                                                                                                                        슝
                                         The present sequence is that of a short interfering RNA (siRNA) molecule targeted to human clusterin ADL70403. The invention relates to the treatment of melanoma through reduction in the effective amount of clusterin. The therapeutic agent may be an antisense oligonucleotide ADL70404-ADL70421 or short interfering RNA (siRNA) ADL70422-ADL7045. It targeted to clusterin. The siRNAs molecules direct cleavage of clusterin mRNA. A method for regulating axpression of bcl-xi in a subject or cell line comprises administering an agent effective to modulate the amount of clusterin expression. In clusterin-expressing cells, expression of bcl-xi is down-regulated when the effective amount of clusterin is reduced. Such inhibition is significant because bcl-xi is known to act as an inhibitor of apoptosis.
                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Treating melanoma in a mammalian subject comprises administering to the subject a therapeutic agent effective to reduce the effective amount of clusterin in the melanoma cells.
